ABSTRACT

Let $G = (V, E)$ be a simple graph. A set $S \subseteq V(G)$ is called an outer-connected dominating set (or ocd-set) of G, if S is a dominating set of G and either $S = V(G)$ or $V \backslash S$ is a connected graph. In this paper we introduce a polynomial which its coefficients are the number of ocd-sets of G. We obtain some properties of this polynomial and its coefficients. Also we compute this polynomial for some specific graphs.

Keywords: Ocd polynomial; outer connected dominating set; coefficient
